

# “Groove Tube” Growing System

The “Groove Tube” System™ is unique in its design. Sharp grooves in the side walls discourage roots from circling. A large drainage hole promotes air-pruning and dramatically assists in the development of additional auxiliary roots. The added depth of the cell means greater exposed surface for regeneration of roots when transplanting. The “Groove Tube” System trays are vacuum formed of high-impact, polystyrene plastic, and can be re-used.
